### **Secure Mail Anti-Spam Solution by Secure Enterprise Computing continues to perform at top of the industry standards**

RTP, N.C. – Secure Enterprise Computing (SEC), a recognized leading computer security firm based in Morrisville, N.C. has announced the update of their hosted Anti-Spam/Anti-Virus service to level SM-8.3.

Chris Harper, Executive Vice President of SEC, stated, “Over the past six months the spammers have changed their methods for getting spam and viruses past most commercial anti-virus and anti-spam systems. We have companies calling us and signing up for our service that say they went from getting just a few spam messages per day to a minimum of 60 or 70 spam messages per day. We are proud of the fact that the companies using our hosted service are still being protected at the highest level, with 98.7% of all spam stopped and 100 percent of all virus attacks. Even with the upgrades we have made to our system, the investment a customer makes per month for our service is still only a fraction of maintaining such a system in house.”

SecureMail is a hosted service provided by SEC to many different types of companies in many segments of the market, including finance, government, insurance, pharmaceutical, manufacturing, large on-line retailers and many small- and medium-size companies.
